CNS, but isoform a is expressed predominantly in the peripher: tissues. Isoform a is also highly expressed in the frontal lot skeletal muscle and spinal cord and is expressed in the frontal lot skeletal muscle and spinal cord and is expressed at a lower le in the lung, lymphoblast and intestine.

-I- PTM: Proteolytically cleaved. The cleavage may be involved in degeneration: the isoform fragments may exert distinct toxic influences that could contribute to selective neurodegeneration: to 18 repeats) in the normal population and is expanded to aby 38-130 repeats in SCAP patients. Intermediate alleles with 28 35 repeats are prone to further expansion.

-I- DISEASE: Defects in SCAP are the cause of spinocerebellar ata: type 7 (SCAP) [MIM:164500]; also known as autosomal dominant creebellar ataxia type II (ADCA-II). SCAP is characterized by pigmentary macular dystrophy and retinal degeneration leading blindness.
FUNCTION: Involved in neurodegeneration.
SUBUNIT: Interacts with SH3P12, FSWC1 and CRX.
SUBCELLULAR LOCATION: Nuclear. In addition to a diffuse distribution throughout the nucleus, it is associated with the nuclear matrix and the nucleolus. Isoform b is cytoplasmic.

Note=No experimental confirmation available;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: Expressed at highest levels in cerebellum spleen. In the cerebellum, expressed mainly in granule cells a to a lesser extent, in Purkinje cells.
DBVELOPMENTAL STAGE: Low levels are found at postnatal day 4.
Levels increase from postnatal day 7 to postnatal day 17. Leve decrease and remain low in the adult.
SIMILARITY: Belongs to the AND32 family.
SIMILARITY: Contains 4 leucine-rich (LRR) repeats.

 Fatty acid synthetase catalyzes the formation of fatty acids from acetyl-CoA, malonyl-CoA, and NADH. Subunit contains domains for: acyl carrier protein, [acyl-carrier protein] reductase, and 3-oxoacyl-[acyl-cen] synthase. This subunit coordinates the binding beta subunits to the enzyme complex. ACTIVITY: Acetyl-CoA + N malonyl-CoA + 2N NADPH = a acyl-CoA + N CoA + N CO(2) + 42N NADPH + malonyl-[acyl-carrier protein] + malonyl-[acyl-carrier protein] + malonyl-[acyl-carrier protein] + co(2) + downloadyl-[acyl-carrier protein] + CO(2) + downloadyl
 ACTIVITY: (3R)-3-hydroxyacyl-[acyl-carrier protein]
3-oxoacyl-[acyl-carrier protein] + NADPH.

Usage by and for commercial irres a license agreement (See http://www.isb-sib.ch/announce/ill to license@isb-sib.ch).
 Specifically inhibits activated STAT signaling and acts scriptional corepressor of STATI, without blocking its activity. Represses the activity of a Whit-responsive ign activity. Represses the activity of a Whit-responsive ion factor, LEFI, by stimulating sumoylation and ind into nuclear bodies. Also interacts with the C-region of tumor suppressor protein p53 and inhibits p53-ransactivation of target genes BAX and CDKNIA/p21 by the DNA-binding activity.

WE LOCATION: Nuclear.
SURFICITY: During embryo development, expressed in the last of the neural tube (EB.5), neuroepithelium of the and hindbrain (EB.0.5), neural tube, eye, limb buds and scrops (EB.1.5), hindlimbs, forelimbs and forebrain sveloping limb buds and single cells of the mesenchyme of future digit strutures (EB.3.), inner root sheath of lair follicle (EI5.5) and epithelium of olfactory and the less in adult mice, expressed in most major organs, but iver and lung.

TAL STAGE: In the embryo, expressed from day 7.5 and eight broughout development. Also expressed in the adult.

C -1 FUNCTION: Adaptins are components of the adaptor complexes w.

Ink clathrin to receptors in coated vesicles. Clathrin-asson protein complexes are believed to interact with the cytoplasm concentration. Binding of AP180 to clathrin triskelia induce:

C -1 FUNCTION: Assembly into 60-70 nM coats.

-1 SUBCELLULAR LOCATION: Component of the coat surrounding the cytoplasmic face of coated vesicles in the plasma membrane.
 TISSUE SPECIFICITY: Brain. Associated with the synapses.
TISSUE SPECIFICITY: Brain. Associated with the synapses.
DEYELOPRENTAL STAGE: Developmentally regulated in a pattern coincident with active synaptogenesis and synaptic maturation DOMAIN: Possesses a three domain structure: the N-terminal is residues harbor a clathrin binding site, an acidic middle dof 450 residues, interrupted by an Ala-rich segment, and the C-terminal domain (166 residues).
FTM: Phosphorylated.
SIMILARITY: Contains I epsin N-terminal homology (ENTH) doma:
 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi

gene

```
Hum. Genet. 112:91-97(2003).

-!- FUNCTION: Receptor for both mineralocorticoids (MC) such as aldosterone and glucocorticoids (GC) such as corticosterone cortisol. Binds to mineralocorticoid response elements (MRE) transactivates target genes. The effect of MC is to increase and water transport and thus raise extracellular fluid volume blood pressure and lower potassium levels.

-!- SUBUMIT: Heteromultimeric cytoplasmic complex with HSP90, HSI and FKBP4, in the absence of ligand. After ligand binding, it translocates to the nucleus and binds to DNA as a homodimer; a heterodimer with NR3C1. Binds the coactivator NCOA2 (By similarity). May interact with HSD11B2 in the absence of ligst Binds the coactivators NCOA1, TIF1 and NRIP1.

J. Biol. Chem. 277:1229-1234(2002).

-!-FUNCTION: Nuclear receptor coactivator that directly binds nu receptors and stimulates the transcriptional activities in a hormone-dependent fashion. Coactivator expression in an agoni and APZ-dependent manner. Involved in the coactivation of different nuclear receptors, such as for steroids (GR and ERS: retinoids (RARS and RKRS), thyroid hormone (TRS), vitamin D3 and prostanoids (PPARS). Probably functions as a general coactivator, rather than just a nuclear receptor coactivator.

also be involved in the coactivation of the NP-kappa-B pathwa: interaction with histone acetyltransferase proteins. Involved placental, cardiac, hepatic and embryonic development.

SUBUNIT: Monomer and homodimer. Interacts in vitro with the bit transcription factors GTP2A and TBP, suggesting an autonomous transcription factors GTP2A and TBP, suggesting an autonomous transcription factors GTP2A and TBP, suggesting an autonomous transcription factors GTP2A and TBP, suggesting an autonomous transcription factors GTP2A and TBP.

Histone acetyltransferase proteins BP300 and CRBBBP, and with methyltransferase proteins NCOA6IP and HRWIILI (By similarity interacts with RNPC2. Belongs to the ASC-2/NCOA6 complex (ASC which contains ASC-2/NCOA6, the retinoblastoma-binding protein Proteins ML2 and ML3, and ASH2/ASCL2 (By similarity).

 omic sequence of Corynebacterium glutamicum ATCC 13032."; 7-2002) to the EMBL/GenBank/DDBJ databases.
 With S4 and S12 plays an important role in translational
 Party of the 30S ribosomal subunit. Contacts proteins S4 (similarity).

Noteminal domain interacts with the head of the 30S is C-terminal domain interacts with the body and protein S4. The interaction surface between S4 and S5 is contains 1 S5 DRM domain.

(*Contains 1 S5 DRM domain.

(*Belongs to the S5P family of ribosomal proteins.

 Sex determination switch protein which controls sexual to be sex specific splicing. Regulates dosage on in females by suppressing hyperactivation of X-linked ression of the embryo-specific isoform is under the primary sex-determining signal, which depends on the chromosomes relative to autosomes (X:A ratio).

I occurs in X:As calls, but not in X:As calls The X:A is to be signaled by the relative concentration of the X-unscription factors SIS-A and SIS-B. As a result, the culstific product is expressed early only in female embryos itself female-adult specific splicing; in the male where it ressed, the default splicing gives rise to a truncated stall protein. The female-specific isoform specifics the its own transcript, thereby initiating a positive itory feedback loop leading to female development. The female-specific isoform controls the sex-specific fit transformer (TRA); acts as a translational repressor specific lethal-2 (MSL-2) and prevents male-less (MLE), MSL-3 proteins from associating with the female
